Piece of Shit: The only art project on-chain that is equally important as Bitcoin.

The Plot

Own a piece of Doge's shit on the blockchain. A piece of pure decentralized art online that no one can take down or steal from its collective owners.

Abstract

We have a 32x32 grid fully coded and rendered on-chain. On this grid, there is an art of Doge's defecation coded into it, and this art is rendered as an NFT and visible on any NFT marketplace. Sometimes, when you buy a token, it might come as an NFT instead of a typical ERC-20 (actually, our ERC-20 can transform into NFT format if you are lucky enough). That NFT has properties such as color and position on the grid. If you are lucky enough, you might get an NFT—chances of getting an NFT are 10%. The NFT can be sold like an ERC-20 back to the liquidity pool or sold on an NFT marketplace.

In short, we added an extra layer of value to this project: an immutable art piece made of NFT pixels that people can earn, allowing them to own a piece of Doge's shit on-chain. Ownership of these tokens grants control over specific pixels. When traded, pixels are temporarily burned and re-minted, ensuring continuity and dynamic changes.

Tokenomics

- 10,240 fixed total supply
- 1,024 NFT tokens
- One extra NFT aka "Shit Painting"
- Each pixel NFT has color and position metadata

Mechanics

- Burn NFT on Sale: Selling a transformed (half ERC-20 half NFT) token burns its linked pixel, leaving a blank space on "Shit Painting".
- Re-Mint on Buy: The pixel reappears when the token is acquired by a new holder.
